Work Distribution NLP

Sara Stanić Siemen Geurts
i6141502 i6166476

May 2019

The work was distributed about 70%/30% for Siemen and Sara respectively, where Siemen was mostly working on transforming and preprocessing the input, whereas Sara was focussing on setting up the prediction models and doing some research on possible prior literature. Adapting the input proved to be a far harder task, though the distribution was not altered. Both did not interfere much in each others' work, mostly discussing several approaches and which to apply. The dataset was found by Sara, and investigation on it was done by Siemen. He also adapted the table used as data from the dataset provided by merging several tables together. Both were fine with the work distribution and no complaints are raised regarding this issue.
